TO DILYSINE MOTIFS AND REVERSIBLY ASSOCIATES WITH GOLGI NON-
CLATHRIN-COATED VESICLES, WHICH FURTHER MEDIATE BIOSVINHETIC
PROTEIN TRANSPORT FROM THE ER, VIA THE GOLGI UP TO THE TRANS GOLG
NETWORK. COATOMER COMPLEX IS REQUIRED FOR BUDDING FROM GOLGI
MEMBRANES, AND IS ESSENTIAL FOR THE RETROGRADE GOLGI-TO-ER
TRANSPORT OF DILYSINE-TAGGED PROTEINS (BY SIMILARITY).
SUBUNIT: OLIGOMERIC COMPLEX THAT CONSISTS OF AT LEAST THE ALPHA,
BETA, BETA, GAMMA, DELTA, EPSILON AND ZETA SUBUNITS.
SUBCELLULAR LOCATION: THE COATOMER IS CYTOPLASMIC OR POLYMERIZED
ON THE CYTOPLASMIC SIDE OF THE GOLGI, AS WELL AS ON THE
VESICLES/BUDS ORIGINATING FROM IT (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SIMILARITY: BELONGS TO THE COPG FAMILY.
